

Workflow: Overview · 1 Collect · 2 Validate · 3 Visual check · 4 Upload · 5 Aggregate · 6 Create map · **Glossary**

Step 3: Visual plausibility check

Overview

Tool: Online validator

Performed by: KfW sector teams (project managers/ project analysts)

Maintained by: KfW Team Data Analytics & Artificial Intelligence (DAI)

Previous step: 2 Validate

Next step: 4 Upload data

Purpose

Visually verify that validated project locations appear correctly on the map before uploading to the ODP.

Requirements

- Validated GeoJSON from Step 2: Validate
- Use the online validator

Procedure

1. Using the online validator, upload validated GeoJSON with the Upload File button and inspect the map view: confirm project locations are displayed in expected locations/ area.

2. Check that multi-geometry features render correctly. If locations look implausible, return to Collect to correct the data before re-validating.

✓ **Plausible result**

- Multi-geometry Project Locations displayed on the map
- Locations fall within expected countries/ regions
- No obvious outliers or missing projects

✗ **Implausible result**

- No locations displayed
- Locations in wrong geography

Outputs

Item	Format	Notes
Validated Project-level Locations (confirmed)	GeoJSON	Ready for upload to KfW's internal Open Data Platform (ODP)
