

Updating existing data

Some teams began collecting Project Locations with **older Project Locations Model (PLM) Excel template versions**. This page describes how to transition to the **current workflow** before continuing with **Step 1: Collect**. The current workflow assumes **PLM v4**.

Data already on ODP

- Existing consultants should use **their own copy** of the existing Project Locations data. **Check the PLM version** used in that file. Continue updates in line with that version, or **migrate to PLM v4** if required before validation.
 - New consultants should directly use the newest PLM template and begin with **Step 1: Collect**.
-

Data not yet on ODP (PLM older than v4)

If the collection of Project Locations has begun with an **older PLM template**:

1. Download the **latest PLM (v4)** from the Project Locations Model.
2. **Manually transfer** existing data from the older template into the new file.
3. Treat the migrated **PLM v4** file as your starting point for further collection or edits and continue onwards to **Step 1: Collect**.
